#### **Direct Link Networks**

- □ Types of Networks
  - Point-to-point
  - Multiple access

- Encoding
  - Encoding bits onto transmission medium
- **□** Framing
  - Delineating sequence of bits into messages
- Error detection
  - Detecting errors and acting on them
- **□** Reliable delivery
  - Making links appear reliable despite errors
- Media access control
  - Mediating access to shared link

3

#### Reliable Transmission

- How to make unreliable links appear to be reliable?
- What to do when a receiver detects that the received frame contains an error?

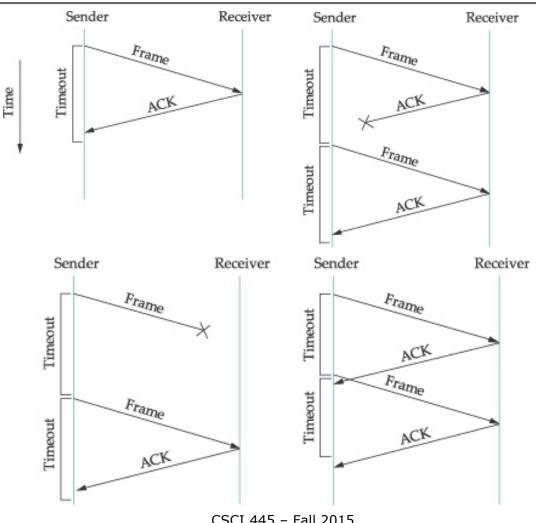

# Acknowledgment and Time-Out

- Two fundamental mechanisms to make channels appear to be error-free
  - Acknowledgements (ACK)
  - Time out
- Automatic Repeat Request (ARQ)
  - Stop-and-Wait
  - Sliding Window
- □ Discuss Stop-and-Wait and Sliding Window protocols in *the context of point-to-point links*

# Stop-and-Wait

- Sender transmits a frame
- Sender *waits* for an acknowledgement before transmitting the next frame
- □ If no acknowledgement arrives after a *time-out*, the sender times out and *retransmits* the original frame

# Stop-and-Wait

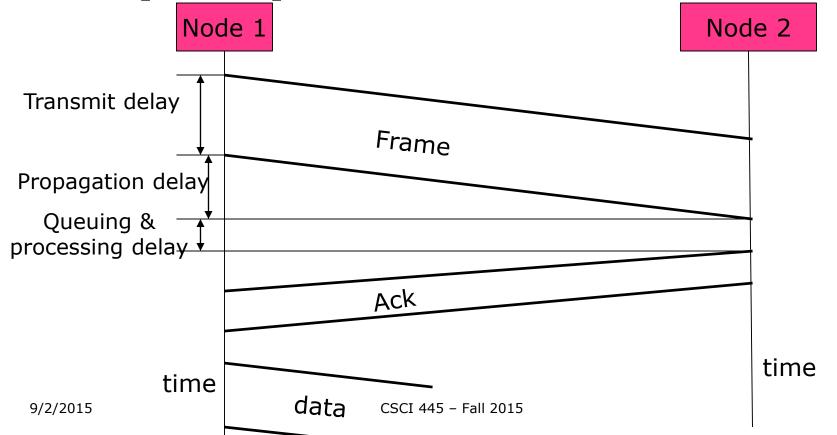

9/2/2015

CSCI 445 - Fall 2015

#### Performance

□ Performance analysis for the stop-and-wait protocol with point-to-point links

8

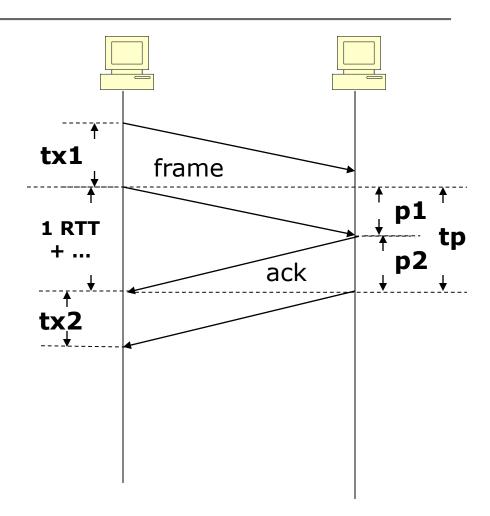

#### Example

- □ Link bandwidth: 10 Gbps
- $\square$  RTT = 40 ms
- $\square$  Frame size = 1500 bytes
- □ Acknowledgement size = 64 bytes
- $\square$  Timeout: 2 × RTT
- $\square$  Assume processing delay is 0
- □ Stop-and-Wait protocol: receiver transmits acknowledge frame upon receiving the data frame
- □ Q: what is the **maximum** throughput (effective bandwidth)?

# Throughput

Q: what is the **maximum** throughput (effective bandwidth)?

- Note: tp = p1 + p2 = 1 RTT
- $\Box$  Transfer time = tx1 + tx2 + tp
- □ Throughput =
  Transfer size/Transfer time
- Q: Is this a good protocol?

#### Timeout?

□ How long should the receiver wait?

□ Timeout: 2 x RTT or more ...

9/2/2015 CSCI 445 – Fall 2015 11

#### Exercise L5-1

- $\Box$  Data frame size (data) = 1500 bytes
- $\blacksquare$  Acknowledgement frame size (ack) = 64 bytes
- Processing delay is 0
- Stop-and-Wait protocol: receiver is forced to wait 1 RTT before transmitting acknowledgement frame after having received data frame
- □ Draw timing-diagram first, and then compute throughputs and link bandwidth utilization for *one* of the following,
  - Dial-up
    - RTT =  $87 \mu s$ ; Link bandwidth: 56 Kbps
  - Wireless LAN
    - $\blacksquare$  RTT = 0.33 µs; Link bandwidth: 54 Mbps
  - Satellite
    - RTT = 230 ms; Link bandwidth: 45 Mbps

# Stop-and-Wait

- Advantage
  - Simple
  - Achieve reliable transmission on non-reliable medium
- Disadvantage
  - Performance is POOR
  - Could you intuitively give an explanation why the performance is POOR?

# Stop-and-Wait

- □ Does not keep the pipe full!
  - Q: How much data are needed to keep the pipe full?
  - Product of Delay × Link Bandwidth
    - $(1 \times RTT) \times 10 \text{ Gbps} = 1 \times 40 \text{ ms} \times 10 \text{ Gbps} = 400 \text{ Mb} = 50 \text{ MB}$
    - $\circ$  50 MB/1500 bytes = 33333 frames
  - 1500 bytes << the product → low link utilization

|                     | Bandwidth | Distance  |                  |                                 |
|---------------------|-----------|-----------|------------------|---------------------------------|
| Link Type           | (Typical) | (Typical) | Round-trip Delay | $\text{Delay} \times \text{BW}$ |
| Dial-up             | 56 Kbps   | 10 km     | 87 μs            | 5 bits                          |
| Wireless LAN        | 54 Mbps   | 50 m      | 0.33 μs          | 18 bits                         |
| Satellite           | 45 Mbps   | 35,000 km | 230 ms           | 10 Mb                           |
| Cross-country fiber | 10 Gbps   | 4,000 km  | 40 ms            | 400 Mb                          |

#### Q: How to keep the pipe full?

# How to keep the "pipe" full?

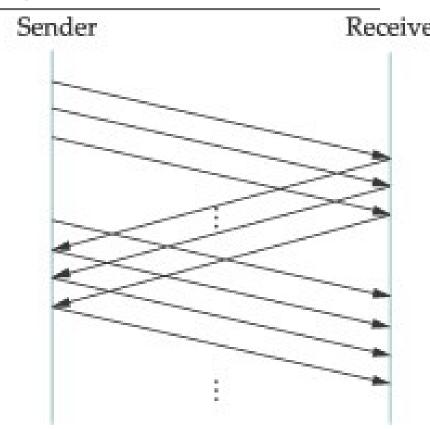

- □ The amount of data needed to keep the pipe full
- **□** Example
  - Link bandwidth: 10 Gbps
  - $\blacksquare$  RTT = 40 ms
  - Stop-and-Wait protocol: receiver transmitting acknowledgement frame upon receiving data frame
  - Data frame size = 1500 bytes
- $\Box$  Delay × Bandwidth = ?
- How many frames that needed to keep the pipe full?
- What is the throughput?

# How to keep the "pipe" full?

□ Free discussion

# Sliding Window Algorithm

- □ Allow multiple
  unacknowledged frames
  (send a few frames in a
  batch) → try to fill the
  pipe
- □ Define a time window (threshold, or upper bound) on unacknowledged frames
  - Sending window
  - Receiving window
- Have variations

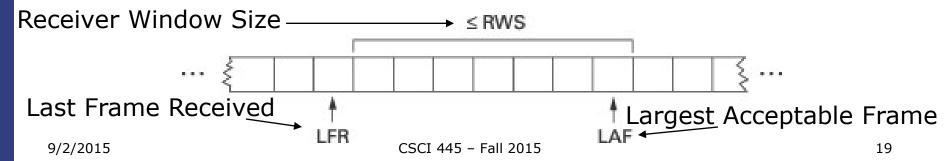

#### Sliding Windows Algorithm: Sender

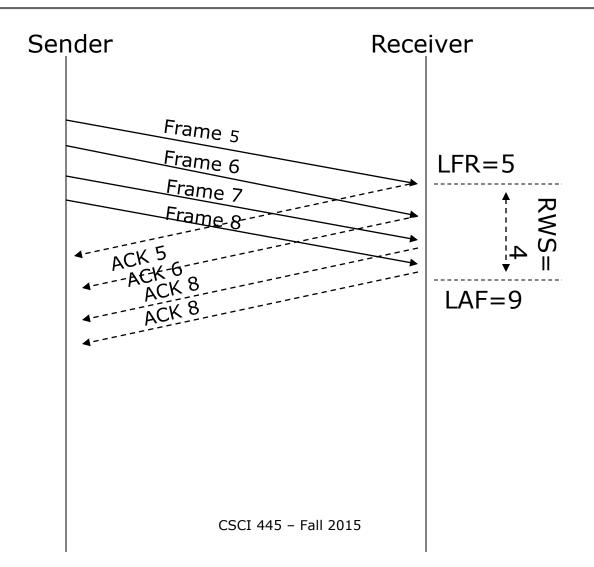

- Assign sequence number to each frame (SeqNum)
- Maintain three state variables:
  - Send Window Size (SWS)
  - Last Acknowledgment Received (LAR)
  - Last Frame Sent (LFS)
- Maintain invariant: LFS LAR <= SWS</p>
- Advance LAR when ACK arrives
- Buffer up to SWS frames

#### Sliding Windows Algorithm: Receiver

- Maintain three state variables
  - Receive Window Size (RWS)
  - Largest Acceptable Frame (LAF)
  - Last Frame Received (LFR)
- Maintain invariant: LAF LFR <= RWS</p>
- Frame<sub>SeqNum</sub> arrives:
  - if LFR < SeqNum < = LAF, accept the frame
  - if SeqNum < = LFR or SeqNum > LAF, discard the frame
- □ SeqNumToAck: largest sequence number not yet acknowledged
- $\square$  ACK is *cumulative*  $\rightarrow$  ACK all frames with less or equal SeqNum

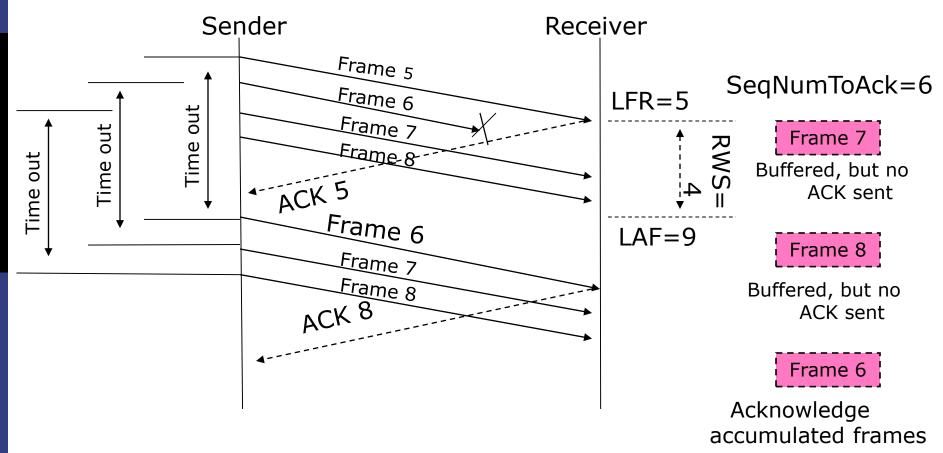

#### Example: No Frame "Loss"

9/2/2015

#### Example: Frame "Loss"

□ Assume that sender does not have more data frame to transmit

# Sliding Window Algorithm: SWS and RWS

- SWS should be determined by the product of delay × bandwidth
- □ RWS does not have to be equal to SWS
  - RWS = 1, does not buffer any frames that arrive out of order
  - RWS > SWS is meaningless, since it is impossible for more than SWS frames to arrive out of order

# Examples

- Consider following sliding window algorithm
  - Caution: Parameters chosen for demos only. In reality they need to be carefully chosen. Check footnote in page 108.
  - Timeout =  $2 \times RTT$
  - SWS (send window size) = 4
    - Determined by delay × bandwidth. Again check footnote in page 108.
  - RWS (receive window size) = 4
- Show timing diagrams for the following scenarios
  - Frame 5 lost
  - Frame 6 lost
  - Frames 5-8 lost
  - ACK 6 lost
  - ACK 8 lost and no more frames to send (for an extended period of time)

#### Sliding Window Algorithm: Implementation – Data Structures

```
typedef u char SwpSegno;
        typedef struct {
            SwpSeqno SeqNum; /* sequence number of this frame */
            SwpSegno AckNum; /* ack of received frame */
            u_char Flags; /* up to 8 bits worth of flags */
        } SwpHdr;
       typedef struct {
           /* sender side state: */
           SwpSeqno LAR; /* seqno of last ACK received */
           SwpSeqno LFS; /* last frame sent */
           Semaphore sendWindowNotFull;
           SwpHdr hdr; /* pre-initialized header */
           struct sendQ_slot {
               Event timeout:
                      /* event associated with send-timeout */
               Msg
                      msg;
           } sendQ[SWS];
           /* receiver side state: */
           SwpSegno
                      NFE:
                      /* segmo of next frame expected */
           struct recv0 slot {
               int
                      received; /* is msg valid? */
               Msq
                    msq;
           } recv0[RWS];
9/2/2015 } SwpState;
                                  CSCI 445 - Fall 2015
```

#### Sliding Window Algorithm: Implementation – Sending

```
static int
sendSWP(SwpState *state, Msg *frame)
    struct sendQ slot *slot;
   hbuf[HLEN];
    /* wait for send window to open */
    semWait(&state->sendWindowNotFull);
    state->hdr.SeqNum = ++state->LFS;
    slot = &state->sendQ[state->hdr.SeqNum % SWS];
    store swp hdr(state->hdr, hbuf);
   msgAddHdr(frame, hbuf, HLEN);
   msgSaveCopy(&slot->msg, frame);
    slot->timeout = evSchedule(swpTimeout, slot,
        SWP SEND TIMEOUT);
    return send(LINK, frame);
```

# Sliding Window Algorithm: Implementation – Receiving (1)

```
static int
deliverSWP(SwpState state, Msg *frame)
    SwpHdr
             hdr:
    char
             *hbuf;
   hbuf = msgStripHdr(frame, HLEN);
   load_swp_hdr(&hdr, hbuf)
   if (hdr->Flags & FLAG_ACK_VALID)
        /* received an acknowledgment---do SENDER side */
        if (swpInWindow(hdr.AckNum, state->LAR + 1,
            state->LFS))
        {
            do
                struct sendQ_slot *slot;
                slot = &state->sendQ[++state->LAR % SWS];
                evCancel(slot->timeout);
                msgDestroy(&slot->msg);
                semSignal(&state->sendWindowNotFull);
            } while (state->LAR != hdr.AckNum);
    }
```

#### Sliding Window Algorithm: Implementation – Receiving (2)

```
if (hdr.Flags & FLAG_HAS_DATA)
    struct recvQ_slot *slot;
    /* received data packet---do RECEIVER side */
    slot = &state->recvQ[hdr.SeqNum % RWS];
    if (!swpInWindow(hdr.SeqNum, state->NFE,
                                                  if (hdr.SeqNum == state->NFE)
        state->NFE + RWS - 1))
    {
                                                      Msg m;
        /* drop the message */
        return SUCCESS;
                                                      while (slot->received)
   msgSaveCopy(&slot->msg, frame);
                                                          deliver(HLP, &slot->msg);
    slot->received = TRUE;
                                                          msgDestroy(&slot->msg);
                                                          slot->received = FALSE;
                                                          slot = &state->recv0[++state->NFE % RWS];
                                                      /* send ACK: */
                                                      prepare_ack(&m, state->NFE - 1);
                                                      send(LINK, &m);
                                                      msgDestroy(&m);
                                             return SUCCESS;
```

#### Exercise L5-2

- □ Draw a timeline diagram for the sliding window algorithm with SWS=RWS=3 frames in the following two situations (draw two time diagrams for each situation). Use a timeout interval of 2 × RTT
  - Frame 4 is lost
  - Frame 4-6 are lost

#### Discussion

- □ Alternatives or improvement
  - Negative Acknowledgement (NAK)
  - Selective Acknowledgement
- ☐ Finite sequence numbers and sliding window
- ☐ Frame order and flow control

# Summary

- □ Reliable delivery
  - Timeout and Acknowledgement
- □ Stop-and-Wait
- □ Sliding Window
- □ Idea: keep the pipe full
  - Many different algorithms exist, e.g., concurrent logical channels
- How to implement?
  - Consult the book
